1. Automation tool used.

Our group revised our automation tool to Katalon Studio for Windows x64, version 8.5.2 due to the sudden requirement of payment for our previously mentioned testing tools.

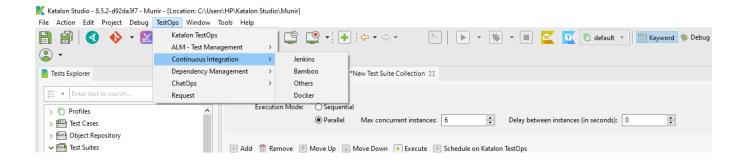

The Pros of Cons of Katalon Studio:

Every automated testing tool has there pros and cons. Let us analyze the pros and cons of Katalon Studio.

Pros of Katalon Studio

1. <u>Seamless integration with CI/DevOps process and other system tools.</u>

Katalon offers a broad range of useful integrations, thus running tests doesn't necessitate any additional extensions. Controlling test requirements, preparing test cases, and defect management are all possible. Users may also quickly link with other systems for managing the SDLC (software development lifecycle), like TestRail, JIRA, and TestLink.

2. Supports several testing types.

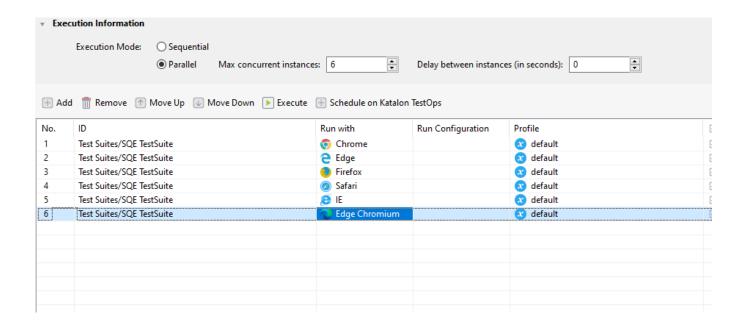

Katalon provides multiple testing types for users.

Data-driven testing: This is a method where tests that are executed include reading test scripts from several data sources. The information is gathered through sources such as Excel files, OBDC, data pools, CSV files, and ADO objects.

Keywords-driven testing: For testers who are not very well experienced in scripting, this method works very well for them. Any tester can perform an automated test based on core keywords that reflect the user behaviors on the applications under test. Customized keywords are also possible.

API-testing: For more improved test coverage, Katalon studio also supports databases with dynamic mapping, XML, and XLS data sources. Additionally, Cucumber, which is a framework for behavior-driven development acceptance testing of web applications, is also compatible with the tests.

Cross-browser testing: All of the main browsers used today are supported by Katalon. This enables the execution of automated tests in Firefox, Chrome, Internet Explorer, Remote, Safari, Edge, Headless, and other customized environments.

3. A very Easy-to-use GUI.

The user interface (UI) of Katalon has extremely rich visuals, tables, tree views, and menus that make managing test artifacts very simple and organized. The tool's User interface is comfortable, clear, user-friendly, and simple to use. This remains true even for non-technical users, according to the testers who used Katalon.

4. An intuitive analytics and reporting dashboard.

The users may assess tests by using recorded scenarios thanks to the integrated, data-driven testing module. The analytics output is presented by Katalon Studio such that it has built-in reports that may be exported to file formats such as HTML, PDF, CSV, or Excel files. The reports produced are easy to use and aesthetically intuitive.

5. Free version available.

The majority of Katalon's users find its fully functional free version to be a tremendous benefit including us. The free basic edition is available for individual use, but the Enterprise version is intended for teams and scalable projects since it has access to other Katalon plugins, additional functionality, and an offline license.

Cons of Katalon Studio

These are some shortfalls of Katalon Studio.

1. A small user community

As a result of Katalon's 2015 development, the community is smaller than that of its more experienced rivals. You might not get as much help from peer testers. There are 706 questions tagged Katalon Studio on Stack Overflow, as compared to 87,555 questions marked Selenium.

2. Performance hindrance.

Some bugs that users report hinder and slow down testing. The text and object verification within the iframes is also challenging. For instance, and the tool occasionally freezes or starts to slow and this is a big issue when the tool is starting and setting itself when opened.

3. Not an Open source software

Due to the tool's closed source code, there are fewer developers in the community. One of Katalon's primary rivals is Selenium. It is an opensource tool that allows engineers to modify it or use packages created by the community, which means people prefer open-source software.

2. Selection criteria for Katalon Studio automation tool.

We chose Katalon Studio for multiple reasons:

1. The tool was free. The tool was absolutely for a sort of free trial or any need to enter the credit card details. This makes it easy for testers to focus on their goals instead of us focusing on making new accounts downloading other testing tools, or worrying about the trial period ending.

- 2. The software can integrate very well with other software. We can run the tool on almost all browsers, deal with all file formats, and synchronize our work with project management tools such as JIRA.
- 3. This single software allows multiple testing to take be performed. We can perform API testing, cross-browser testing, and even data-driven testing. As we will need to use a database, data-driven testing will come in handy.
- 4. It is very easy to use and promotes new testers to learn to test. The GUI, the analytics dashboards, and the reporting tools are highly usable. It means one can focus on testing easily.
- 5. They have their own complete video playlist which one can watch to master the tool easily. It starts from installations and goes up to technical guides.

3. Applications which it has been applied on.

This tool we used was applied to two websites. First, we applied the tool on Indus Hospital's website and on Facebook. We applied it to Indus hospital as we will also make software closely related to healthcare so we ran it there to check the donate functions, URL redirecting, merchandise purchase, checking for nearest blood centers, etc. We used Facebook as we will also provide a login option on our website so this feature was tested on Facebook. On the whole, the tool can be applied to websites, mobile phone applications, APIs, and desktop applications as well.

Some other applications which it may be applied on.

Katalon was initially designed to reuse and create automated test scripts for the User Interface without coding. KS also allows checking for popups, iFrames, and wait times.

Some notable companies that use Katalon Studio.

- Care Logistics: Quick system stability testing was a difficulty for Care Logistics, a business that offers software and services for healthcare logistics to hospitals and health centers. They used KS to convert these test cases into automated ones from manual ones.
- Tunaiku: This Indonesian fintech loan company has to guarantee the security of users for their transactional data. Numerous quality assurance tests in the CI workflow, which incorporates Jenkins and Docker, were necessary for this. So they used KS to solve quality assurance problems and reduced scripting time by 60%.
- Angler: Katalon Studio was also utilized by Indian Internet and technology provider Angler to test their APIs. It was their responsibility to create API scripts, test APIs, find flaws during the development process, and stop them from making it into APIs. As a consequence, Angler used Katalon Studio to cover more than 80% of functional testing.

4. Execution of the test cases.

We had a total of 5 test cases. These test cases were comprised of successful and unsuccessful activities such as website logins, website purchases, site redirections, and website donations of money.

1. Donating money function with invalid data.

In this test case, we tested the website for the option of donating money to the hospital. We entered incorrect billing addresses, optional billing addresses, and the billing city. As these were all entered incorrectly, the website did not let us proceed. This is also reflected in the tool record as we were unable to proceed even after we clicked donate.

ltem	Object	Input	Output	Desc

2. Testing for successful link redirections.

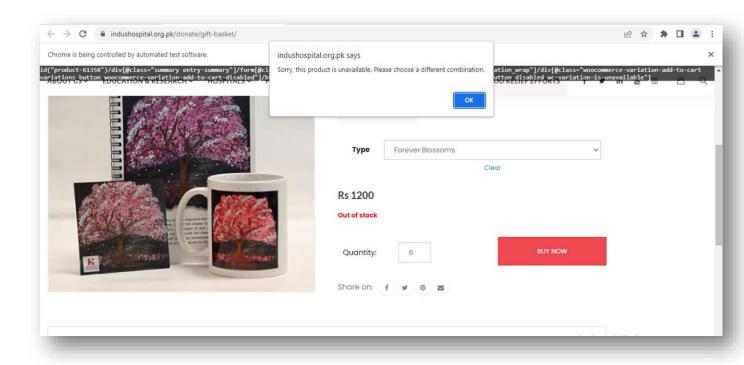

In this test case, we tested if we were successfully getting a redirection when we clicked on the required links. We check for open blood donation centers, the about us page for the hospital, the network of the hospital, and how the hospital started.

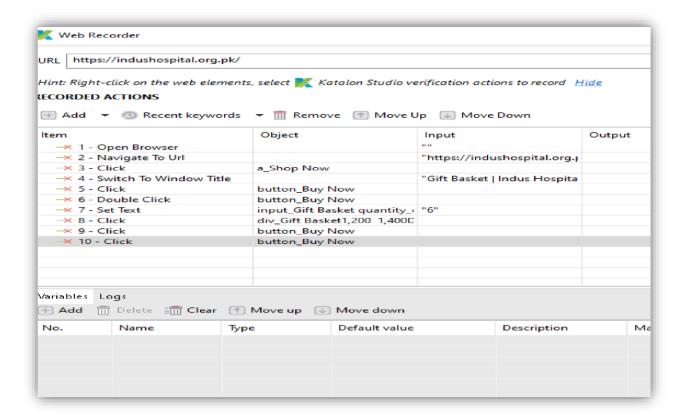

Item	Object	Input	Output	Des
→ 1 - Open Browser		ш		
→ 2 - Navigate To Url		"https://indushospital.org.pk/online	-	
→ 3 - Click	a_Flood relief efforts			
→ 4 - Click	span_Donation Collection Center			
→ 5 - Click	span_Ways To Donate			
→ 6 - Click	span_Ways To Donate			
→ 7 - Click	img_Flood relief efforts_img-responsive zoz_0b6efd			
→ 8 - Close Browser

3. <u>Buying an out-of-stock item from the hospital</u> <u>merchandise.</u>

We tried to buy items from the website which were out of stock. We first went to the shop now tab, and tried to buy an empty cart. This can be seen and our request was not catered. Then we tried to buy 6 items but again we were unable to complete our transaction as the items were out of stock. This shows invalid operations cannot be performed on the site and the inability to purchase is reflected in the testing tool record.

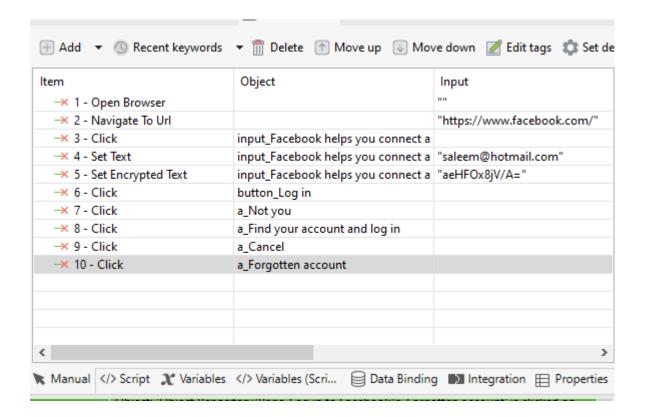

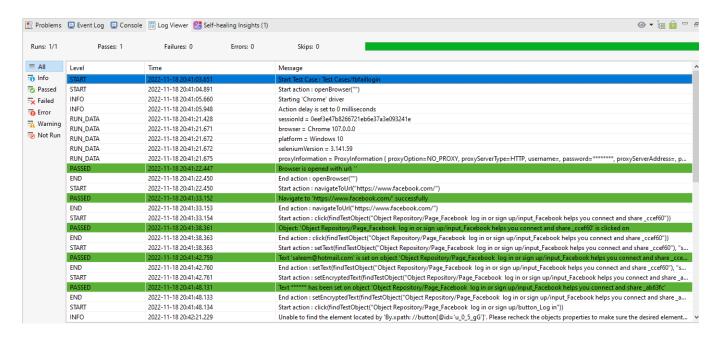

4. Unsuccessful login attempt on Facebook.

The Indus Hospital had no login page which is why we used Facebook to check for valid and invalid login attempts. The email was entered, and the password was entered. Notice how the password is first encrypted and then sent over to the browser which advocates positive feedback for a secure transfer protocol for our website security for sensitive data. Then since access is not granted due to a wrong password, we click on forgot password. Then the reset password option is selected which asks the question, is this account yours while showing the display picture. I selected "not you" and was redirected out.

INFO	2022-11-18 20:43:15.276	

For the 10 script lines we receive 11 passes. All statements pass successfully even though we can note warnings which are solved by Katalon's self-healing code that detects the button of login, that too without the need to code. This test case is successful.

5. Successful login attempt on Facebook

Here we attempted to log in to the account. I input my email as seen, and again we note the set encrypted text and input our password. Which is again sent in an encrypted format. It was incorrect so we are not redirected. Then I enter the password again. Then we click the login button and this time we are redirected to the stores, reels, rooms, and page which is the Facebook feed page. This means that I successfully logged in to my account.

Automated script:

tem	Object	Input	Output
→ 1 - Open Browser		···	
→ 2 - Navigate To Url		"https://www.facebook.com/"	
→ 3 - Set Text	input_Facebook helps you connect a	"johnlindth@hotmail.com"	
→ 4 - Set Encrypted Text	input_Facebook helps you connect a	"RiVLgM9Ycm4hI7BCtax5/g=="	
→ 5 - Click	button_Log in		
→ 6 - Double Click	a_Facebook Menu_x1i10hfl xjbqb8w

Note since the testing tool supports a complete GUI interface, it does face some issues in locating objects. This makes it easy for the tester as now they don't need to know coding knowledge.
